Fluid Mechanics

NonNewtonian Fluids

1

Outline

2

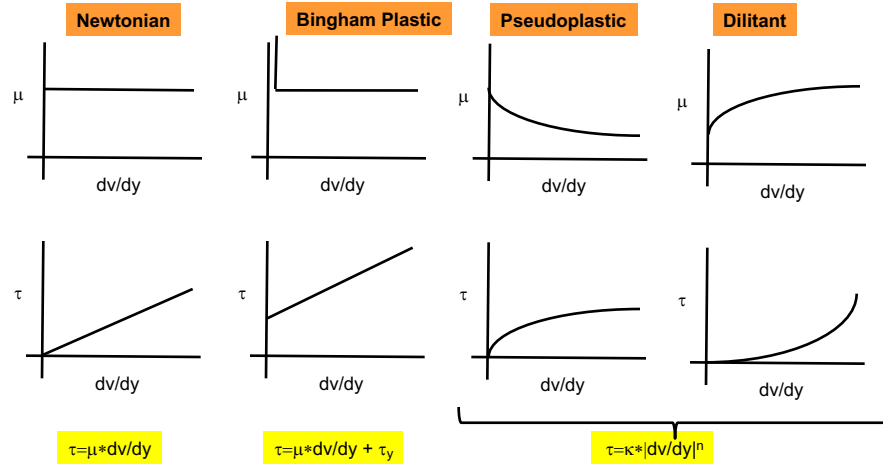

- Types and properties of non-Newtonian Fluids
- Pipe flows for non-Newtonian fluids
- Velocity profile / flow rate
- Pressure drop
 - Friction factor
 - Pump power
- Rheological Parameters

Power Law Fluids

Non-Newtonian Fluids

3

Bingham Plastic

4

- 3D elastic structures. Weak solid structures that must be broken
- Resists small shear, but structure “breaks apart” with large shear.
- Then τ is \sim linear with du/dx
- Some slurries (coal, grain slurries), sewage sludge.
 - Toothpaste (no drip)
- Larger particles \rightarrow weak solid structure \rightarrow breaks

Pseudoplastic

- Most common
- Dissolved or dispersed particles, like dissolved long chain molecules.
- Have a random orientation in the fluid at rest, but line up when the fluid is sheared.
 - τ decreases with strain rate
 - μ drops as molecules align
- Polymer melts, paper pulp suspensions, pigment suspensions, hair gel, blood, muds, most slurries
- “Shear-Thinning”
 - motor oil

$$\tau = K * (-dv/dy)^n$$

Dilutant

- Rare
- Slurries of solid particles with barely enough liquid to keep apart. (corn starch, water squeezed out at high shear)
- At low strain rates, the fluid can lubricate solids; at high strain rates, this lubrication breaks down.
- μ increases with strain $\rightarrow \tau$ increases.
- “Shear thickening”.

$$\tau = K * (-dv/dy)^n$$

Non-Newtonian

7

Time dependence

8

- Thixotropic
 - Slurries/solutions of polymers
 - Many known fluids
 - Most are pseudoplastic
 - Alignable particles/molecules with weak bonds (H-bonding)
 - Paint
- Rheopectic
 - Rare
 - Fewer known examples
 - Usually fluids only show this behavior under mild shearing
- Changes occur within the first 60 sec. for most processes.
- Hard to describe
- Viscoelastic

Power Law Fluids

- Governing equations are “correct” in terms of τ
 - Expression for τ is the model.
 - Called a “constitutive relation”
 - Also have these for mass and heat fluxes in heat and mass transfer.
 - Newtonian flow
$$\tau = -\mu \frac{dv}{dy}$$
 - For dilatant and pseudoplastic fluids (most common)—**Power Law**

$$\tau = K \left(-\frac{dv}{dy} \right)^n$$
 - $n > 1 \rightarrow$ Dilatant
 - $n < 1 \rightarrow$ Pseudoplastic
 - $n = 1, K = \mu \rightarrow$ Newtonian
 - K, n are empirical constants
 - Many other forms
 - Simpler ones have 3 parameters and give a better fit, but are more complex than power law form.
 - See Handout of Book Chapter on Webpage.

Laminar Pipe Flow

Force Balance: Pressure, stress

$$(P_x - P_{x+\Delta x})(2\pi r \Delta r) + (2\pi \Delta x r)\tau_r - (2\pi \Delta x)(r + \Delta r)\tau_{r+\Delta r} = 0$$

Divide $2\pi \Delta r \Delta x$

$$r \frac{P_x - P_{x+\Delta x}}{\Delta x} + \frac{r\tau_r - (r + \Delta r)\tau_{r+\Delta r}}{\Delta r} = 0$$

Limit $\Delta x, \Delta r \rightarrow 0$

$$-\frac{dP}{dx} = \frac{1}{r} \frac{d(r\tau)}{dr} = C$$

Separate variables and integrate with $\tau=0$ at $r=0$
$$\tau = -\frac{r}{2} \frac{dP}{dx}$$

Non-Newtonian Pipe Flow

- Most non-Newtonian flows are laminar.
- Key results: (remember, Q is just volumetric flow rate-Vdot)

– Force balance: $\tau = -\frac{r}{2} \frac{dP}{dx}$

– Power law constitutive relation: $\tau = K \left(-\frac{dv}{dr} \right)^n$

– Integrate with B.C. $v=0$ at $r=R$: $v = \left(-\frac{1}{2K} \frac{dP}{dx} \right)^{1/n} \left(\frac{n}{n+1} \right) \left(R^{\frac{n+1}{n}} - r^{\frac{n+1}{n}} \right)$

– $Q = Av_{avg}$
 • Q is volumetric flow rate $Q = \frac{\pi n D^3}{8(3n+1)} \left(-\frac{D}{4K} \frac{dP}{dx} \right)^{1/n}$ $V_{avg} = \frac{nD}{2(3n+1)} \left(-\frac{D}{4K} \frac{dP}{dx} \right)^{1/n}$

– Kinetic Energy Correction Factor: $\alpha = \frac{3(3n+1)^2}{(5n+3)(2n+1)}$

– Momentum Flux Correction Factor: $\beta = \frac{3n+1}{2n+1}$

Pressure Drop—Laminar Flow

Define $f = \frac{4\tau_w}{\frac{1}{2}\rho v_{avg}^2}$ **1**

Force Balance $\frac{dP}{dx} = -\frac{2\tau_w}{R}$ **2**

$$V_{avg} = -\frac{1}{\pi R^2} \int_A v(r) dA$$

Newtonian

$$v = -\frac{R^2}{4\mu} \left(\frac{dP}{dx} \right) \left(1 - \frac{r^2}{R^2} \right)$$
 3

$$V_{avg} = -\frac{R^2}{8\mu} \left(\frac{dP}{dx} \right)$$
 4

$$\tau_w = \frac{4\mu V_{avg}}{R}$$

$$f = \frac{64}{Re}$$

Solve 4 for dP/dx
and insert into 2

$\tau_w =$ (some complex expression)

Insert into 1 for τ_w

$$f = \frac{8K}{\rho V_{avg}^2} \left(\frac{2(3n+1)V_{avg}}{nD} \right)^n$$

Non-Newtonian

$$v = \left(-\frac{1}{2K} \frac{dP}{dx} \right)^{1/n} \left(\frac{n}{n+1} \right) \left(R^{\frac{n+1}{n}} - r^{\frac{n+1}{n}} \right)$$

$$V_{avg} = \frac{nD}{2(3n+1)} \left(-\frac{D}{4K} \frac{dP}{dx} \right)^{1/n}$$

Turbulent Flow

- Define the friction factor as before: $f = \frac{8\tau_w}{\rho V_{avg}^2} = \frac{\Delta PD/L}{\frac{1}{2}\rho V_{avg}^2}$
 - (Laminar or Turbulent)
- For turbulent flow we had $f = f(\text{Re}, \varepsilon/D)$ from dimensional analysis.
- Question: Will this work for non-Newtonian Flow?
- Question: What is the Reynolds number?
 - No clear definition of Re since μ is not constant (depends on the strain rate dv/dr , which depends on V_{avg})

- Use the same definition as the laminar friction factor: $\text{Re}=64/f$

$$f = \frac{8K}{\rho V_{avg}^2} \left(\frac{2(3n+1)V_{avg}}{nD} \right)^n \longrightarrow \boxed{\text{Re} = \frac{8\rho V_{avg}^2}{K} \left(\frac{nD}{2(3n+1)V_{avg}} \right)^n}$$

- (Definition based on laminar Newtonian, but used for all regimes)

- Plot friction factor versus Re as for Newtonian flows, using the red definition of Re.

Non-Newtonian Friction Factor (Power Law)

Rheological Parameters (power law)

- **Problem:** Non-Newtonian fluid has: $\tau = K \left(-\frac{dv}{dr} \right)^n$
 - How to find K, and n for a given fluid?
- You need to measure something (what?)
- Try a pipe flow
 - D, Q, dP/dx
- Here's what we know:

$$\tau = K \left(-\frac{dv}{dr} \right)^n \quad v = \left(-\frac{1}{2K} \frac{dP}{dx} \right)^{1/n} \left(\frac{n}{n+1} \right) \left(R^{\frac{n+1}{n}} - r^{\frac{n+1}{n}} \right)$$

$$\tau = -\frac{r}{2} \frac{dP}{dx} \quad Q = \frac{\pi n D^3}{8(3n+1)} \left(-\frac{D}{4K} \frac{dP}{dx} \right)^{1/n}$$

$$\tau_w = K \left(-\frac{dv}{dr} \right)_w^n \quad V_{avg} = \frac{nD}{2(3n+1)} \left(-\frac{D}{4K} \frac{dP}{dx} \right)^{1/n}$$

$$\tau_w = -\frac{R}{2} \frac{dP}{dx}$$
- D, Q, dP/dx \rightarrow V_{avg} , τ_w .
- Then relate these to K, n: $\tau_w = K \left(-\frac{dv}{dr} \right)_w^n$
 - Compute $(-dv/dr)_w$ from $v(r)$

Rheological Parameters (power law)

- From $v(r)$, we get: $\left(-\frac{dv}{dr} \right)_w = \frac{2(3n+1)V_{avg}}{nD}$
- Now $\tau = K \left(-\frac{dv}{dr} \right)^n \rightarrow \ln(\tau_w) = \ln(K) + n \ln(-dv/dr)_w$
- So a plot of $\ln(\tau_w)$ versus $\ln(-dv/dr)_w$ is linear with slope n, and intercept $\ln(K)$.
- But, note that $(-dv/dr)_w$ involves n, which is unknown \rightarrow what to do?
- Just rearrange:

$$\ln(\tau_w) = \ln(K) + n \ln(2(3n+1)V_{avg}/nD)$$

$$\ln(\tau_w) = n \ln(V_{avg}/D) + [\ln(K) + n \ln(2(3n+1)/n)]$$
- Now, a plot of $\ln(\tau_w)$ versus $\ln(V_{avg}/D)$ is linear with slope n.
- Once n is known, K can be computed from the intercept (term in []), or just compute it analytically from $\tau = K \left(-\frac{dv}{dr} \right)^n$ and $\left(-\frac{dv}{dr} \right)_w = \frac{2(3n+1)V_{avg}}{nD}$ which give

$$K = \frac{\tau_w}{\left(\frac{2(3n+1)V_{avg}}{nD} \right)^n}$$

Recap

- To compute K , n for a non-Newtonian fluid
- Measure Q , D , dP/dx
- Compute V_{avg} from Q and D (area), that is, $Q=A \cdot V_{avg}$
- Compute τ_w from $\tau_w = -\frac{R}{2} \frac{dP}{dx}$
- Plot $\ln(\tau_w)$ versus $\ln(V_{avg}/D)$
- Fit a line to the data (the linear part of the data)
- The slope is n
- K is computed from the intercept I : $K = \exp[I - n \ln(2(3n + 1)/n)]$

$$\text{or from } K = \frac{\tau_w}{(2(3n + 1)V_{avg}/nD)^n}$$

Note, the units on K are $(\text{kg} \cdot \text{s}^{-n-2}/\text{m})$

Example

- Given:
 - Diameter
 - Pressure Drop
 - Flow Rate
- Compute:
 - K , n
 - Re
 - Power through a given pipe is as usual, $Q \cdot \Delta P$

$$n = \text{slope} = 0.7344$$

$$K \text{ based on intercept } I \text{ is } 0.163 \quad K = \exp[I - n \ln(2(3n + 1)/n)]$$

$$K \text{ based on } K = \frac{\tau_w}{(2(3n + 1)V_{avg}/nD)^n} \text{ is } 0.163 \pm 0.0008$$

blue points = 0.0008
